Dynamic Components

Understanding the Different Approaches
- Dynamic components are loaded during **runtime**
- We want to **programmatically** control when the components are loaded
  - ***ngIf**
    - The component is embedded via selector **(declaratively)**
    - *ngIf controls whether the component is added to the DOM
  - **Dynamic Component Loader**
    - The component is created and added to the DOM via code **(imperatively)**
    - The component is managed and added by the developer
